

Arduino-AD9850-DDS

(siehe auch <https://wiki.funkfreun.de/projekte/arduino-ad9850-dds>) Der AD9850 ([Datenblatt](#)) ist ein DDS, der ein Sinussignal von 0-40MHz erzeugen kann.

In diesem Projekt wird er von einem Arduino Nano angesteuert.

Die Frequenzeinstellung sowie die Quartz-Kalibration erfolgt mit einem Drehencoder und einem I2C-Textdisplay (16x2). Die eingestellten Werte können im Arduino-EEPROM gespeichert werden.

Verdrahtung am Arduino		
Modul	Pin Name	Arduino Pin
I2C-Textdisplay	SDA	A4
	SCL	A5
DrehEncoder	CLK	D2
	DT	D3
(Button)	SW	D4 (mit 10kOhm zu VCC)
AD9850	W_CLK	D5
	FU_UD/FQ_UD	D6
	Data	D7
	Reset	D8

- zum Teil integriert (muss nicht installiert werden, hier nur als Referenz) AD9850

<https://github.com/F4GOJ/AD9850> Created 23/08/2014, Christophe Caiveau f4goj@free.fr, Public Domain

Kurze Warnung vorab: ich bin kein Programmierer und es gibt die ein oder andere Stelle, die man noch verbessern könnte*. Auch wenn der Code gut funktioniert, bin ich für jeden Tip per Mail an danielwf@hackerspace-bremen.de dankbar - man lernt ja schließlich nie aus ;)

*Todo: Serielle Frequenzeingabe; DrehEncoder-Eingabe tlw. ungenau; EEPROM-Update wird immer geschrieben, wenn der Mode geändert wird → Nur schreiben, wenn sich der Wert im EEPROM auch wirklich geändert hat.

Das gesamte Projekt inkl. Libraries kann [hier als zip-Archiv herunterladen werden](#).
